

## MA385 Part 4: Linear Algebra 2

**4.4: Gershgorin's Theorems**

Dr Niall Madden

November 2025

*There are some extra details posted as an “Appendix” to this section*

# 1. Outline Section 4.4

- 1 Gershgorin's theorems
  - 2 Gershgorin's First Theorem
  - 3 Gershgorin's 2nd Theorem
  - 4 Using Gershgorin's theorems
  - 5 Exercises
  - 6 Appendix
- Proof of Gershgorin 2

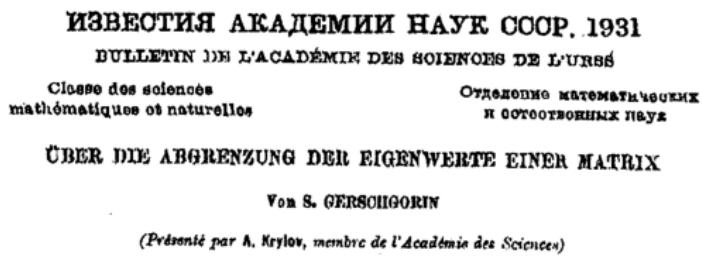

For more, see Section 2.7 of Suli and Mayers:

## 2. Gershgorin's theorems

The goal of this final section is to learn a technique for estimating eigenvalues of matrices.

The idea dates from 1931, and is as simple as it is useful. Although known to mathematicians in the USSR, the original paper was not widely read.

It received main-stream attention in the West following the work of Olga Taussky (*A recurring theorem on determinants*, American Mathematical Monthly, vol 56, p672–676. 1949.)

See also [https://www.math.wisc.edu/hans/paper\\_archive/other\\_papers/hs057.pdf](https://www.math.wisc.edu/hans/paper_archive/other_papers/hs057.pdf)

### 3. Gerschgorin's First Theorem

(See Section 5.4 of Süli and Mayers).

#### Definition 4.4.1 (Gerschgorin Discs)

Given a matrix  $A \in \mathbb{R}^{n \times n}$ , define the  $n$  Gerschgorin Discs,  $D_1, D_2, \dots, D_n$  as the discs in the complex plane where  $D_i$  has centre  $a_{ii}$  and radius  $r_i$ :

$$r_i = \sum_{j=1, j \neq i}^n |a_{ij}|.$$

So  $D_i = \{z \in \mathbb{C} : |a_{ii} - z| \leq r_i\}$ .

### 3. Gerschgorin's First Theorem

#### Theorem 4.4.1 (Gerschgorin's First Theorem)

Let  $D_1, D_2, \dots, D_n$  be the Gerschgorin Discs of the matrix  $A \in \mathbb{R}^{n \times n}$ . Then all the eigenvalues of  $A$  are contained in the union of the Gerschgorin discs.

### 3. Gershgorin's First Theorem

### 3. Gershgorin's First Theorem

The proof makes no assumption about  $A$  being symmetric, or the eigenvalues being real. However, if  $A$  is symmetric, then its eigenvalues are real and so the theorem can be simplified: the eigenvalues of  $A$  are contained in the union of the intervals  $I_i = [a_{ii} - r_i, a_{ii} + r_i]$ , for  $i = 1, \dots, n$ .

#### Example 4.4.1

Let

$$A = \begin{pmatrix} 4 & -2 & 1 \\ -2 & -3 & 0 \\ 1 & 0 & 2 \end{pmatrix}$$

## 4. Gershgorin's 2nd Theorem

### Theorem 4.4.2 (Gershgorin's Second Theorem)

Given a matrix  $A \in \mathbb{R}^{n \times n}$ , let the  $n$  Gershgorin disks be as defined in Theorem 5. If  $k$  of discs are disjoint (have an empty intersection) from the others, their union contains  $k$  eigenvalues.

**Proof:** not covered in class. If interested, see the appendix, or the textbooks.

## 5. Using Gerschgorin's theorems

### Example 4.4.2

Locate the regions contains the eigenvalues of

$$A = \begin{pmatrix} -3 & 1 & 2 \\ 1 & 4 & 0 \\ 2 & 0 & -6 \end{pmatrix}$$

(The eigenvalues are approximately  $-7.018$ ,  $-2.130$  and  $4.144$ .)

## 5. Using Gerschgorin's theorems

### Example 4.4.3

Use Gerschgorin's Theorems to find an upper and lower bound for the Singular Values of the matrix

$$A = \begin{pmatrix} 4 & -1 & 2 \\ 2 & 3 & 1 \\ 1 & 1 & 4 \end{pmatrix}.$$

Hence give an upper bound for  $\kappa_2(A)$ .

## 5. Using Gerschgorin's theorems

To start, note that

$$B = A^T A = \begin{pmatrix} 21 & 3 & 14 \\ 3 & 11 & 5 \\ 14 & 5 & 21 \end{pmatrix}.$$

## 6. Exercises

### Exercise 4.4.1

A real matrix  $A = \{a_{i,j}\}$  is *Strictly Diagonally Dominant* if

$$|a_{ii}| > \sum_{j=1, j \neq i}^n |a_{i,j}| \quad \text{for } i = 1, \dots, n.$$

Show that all strictly diagonally dominant matrices are nonsingular.

### Exercise 4.4.2

Let

$$A = \begin{pmatrix} 4 & -1 & 0 \\ -1 & 4 & -1 \\ 0 & -1 & -3 \end{pmatrix}$$

Use Gershgorin's theorems to give an upper bound for  $\kappa_2(A)$ .

**Proof of Gershgorin's 2nd Thm (Thm 8)** We didn't do the proof in class, and you are not expected to know it. Here is a sketch of it.

Let  $B(\varepsilon)$  be the matrix with entries

$$b_{ij} = \begin{cases} a_{ij} & i = j \\ \varepsilon a_{ij} & i \neq j. \end{cases}$$

So  $B(1) = B$  and  $B(0)$  is the diagonal matrix whose entries are the diagonal entries of  $A$ .

Each of the eigenvalues of  $B(0)$  correspond to its diagonal entries and (obviously) coincide with the Gershgorin discs of  $B(0)$  – the centres of the Gershgorin discs of  $A$ .

The eigenvalues of  $B$  are the zeros of the characteristic polynomial  $\det(B(\varepsilon) - \lambda I)$  of  $B$ . Since the coefficients of this polynomial depend continuously on  $\varepsilon$ , so too do the eigenvalues.

Now as  $\varepsilon$  varies from 0 to 1, the eigenvalues of  $B(\varepsilon)$  trace a path in the complex plane, and at the same time the radii of the Gershgorin discs of  $A$  increase from 0 to the radii of the discs of  $A$ . If a particular eigenvalue was in a certain disc for  $\varepsilon = 0$ , the corresponding eigenvalue is in the corresponding disc for all  $\varepsilon$ . Thus if one of the discs of  $A$  is disjoint from the others, it must contain an eigenvalue.

The same reasoning applies if  $k$  of the discs of  $A$  are disjoint from the others; their union must contain  $k$  eigenvalues.
